1. INTRODUCCIÓN

En el presente anejo se exponen las labores y metodologías empleadas para la obtención de Topografía, fundamento esencial para la realización del presente proyecto de "CONEXIÓN EXTERIOR DE SANEAMENTO DO PARQUE DE ACTIVIDADES ECONÓMICAS DE ARTEIXO".

Los trabajos topográficos han radicado en la confección de un curvado por la banda de terreno por la que transcurrirá el sistema de saneamiento; para ello se obtuvieron los datos de campo por técnicas GPS apoyadas con estación total.

A continuación analizamos con más detalle el proceso, empleado para la toma de datos en las zonas de los colectores del Polígono, Interceptor de Seixedo e impulsión de Sabón.

En el Apendice 4 del presente anejo se adjuntan los datos y proceso empleado para el proceso en la zona del interceptor de Sabón.

2. SISTEMA GEODÉSICO DE REFERENCIA

Se utilizó como sistema de referencia geodésico el denominado European Terrestrial Reference System 1989 (ETRS 89) y el sistema de coordenadas U.T.M. en el huso 29 basado en la proyección cilíndrica conforme del mismo nombre. Como Datum altimétrico se ha utilizado el nuevo modelo de Geoide para España EGM08 materializado por la Red de Nivelación de Alta Precisión (REDNAP) del I.G.N. que proporciona alturas ortométricas referidas al nivel medio del mar en Alicante (NMMA) calculado a partir de los datos de su mareógrafo.

El Real Decreto 1071/2007 establece ETRS89 como sistema de referencia geodésico oficial en España para la referenciación geográfica y cartográfica en el ámbito de la Península Ibérica y las Islas Baleares.

3. RED TOPOGRÁFICA BÁSICA

3.1. RED TOPOGRÁFICA BÁSICA

A partir de este marco de referencia, indicado anteriormente, se crea en Galicia una red de estaciones permanentes de GNSS, compuesta inicialmente por 17 estaciones, llamada GALNET. En el procesamiento llevado a cabo, conjuntamente con la red citada, se han incluido las estaciones permanentes IGS/EUREF de la Península Ibérica que procesa el Instituto Geográfico Nacional como centro de análisis de EUREF, otras estaciones permanentes GPS de Comunidades Autónomas que procesa el IGN dentro del proyecto IBERRED (cálculo continuo de posiciones de estaciones del área ibérica) y las estaciones IGS con coordenadas en el marco IGS05 que sirven de datum para el cálculo (en total 199 estaciones).

Para la observación de las bases y de los puntos que definen fielmente el terreno del proyecto, hemos utilizado como método de observación el denominado Real Time Kinematic (RTK), enganchados a las bases pertenecientes a la red de estaciones permanentes del IGN, denominada ERGNSS, las cuales forman parte de la definición de puntos fundamentales de la Red Europea EUREF de estaciones permanentes (EPN) y a su vez esta queda integrada en la red GALNET coherentemente.

Las correcciones generadas por la GALNET son difundidas en tiempo real a través de internet en el estándar RTCM. El acceso a los datos RTK se realiza a través del Caster NTRIP (Networked Transport of RTCM vía Internet Protocol).

Fuente: http://cartogalicia.com/wp-content/uploads/2015/10/mapa.pdf

Para la toma de datos se empleó un equipo GPS bifrecuencia que nos permite la toma de datos corregidos en tiempo real vía internet por medio de GPRS.

3.2. ESTACIÓN DE REFERENCIA

Como hemos comentado anteriormente hemos utilizado el método RTK que consiste en la obtención de coordenadas en tiempo real con precisión centimétrica (1 ó 2 cm + 1ppm). Es un método diferencial o relativo. El receptor fijo o referencia estará en modo estático en un punto de coordenadas conocidas, mientras el receptor móvil o "rover", es el receptor en movimiento del cual se determinarán las coordenadas en tiempo real (teniendo la opción de hacerlo en el sistema de referencia local). Precisa de transmisión por algún sistema de telecomunicaciones (vía radio-modem, GSM, GPRS, por satélite u otros) entre REFERENCIA y ROVER.

4. METODOLOGÍA DE TRABAJOS DE CAMPO Y GABINETE

Para la realización de los trabajos topográficos, en primer lugar, se procede a la colocación de los clavos topográficos que emplearemos como bases. Estos clavos fueron colocados de tal forma que permitan tener cubierta la zona de trabajo tanto para la medición, como para los sucesivos trabajos que se realicen en el ámbito de las obras.

Una vez colocados los clavos topográficos, se realizaron lecturas sobre estas para dotarlas de coordenadas UTM. Las lecturas fueron tomadas con un GPS en modo RTK, realizando el número de lecturas necesarias para la obtención de la precisión requerida.

Una vez elaborado el sistema de bases, se continúa con el resto de la toma de datos, bien utilizando el citado GPS o la Estación Total, partiendo de las bases anteriormente citadas.

Por último, en gabinete, se realiza la descarga de los datos de campo obtenidos y mediante el software topográfico TCP-MDT V4 se procede a elaborar el Modelo Digital del Terreno de la zona de actuación con curvas de nivel cada 0.2 m.

Como cartografía básica se ha utilizado la descargada del portal web de la Xunta de Galicia (http://mapas.xunta.gal/visores/descargas/) a escala 1:5000.

5. EQUIPOS Y SOFTWARE INFORMÁTICO EMPLEADOS

Para los trabajos de campo se han empleado los siguientes equipos:

GPS Leica GPS1200 de doble frecuencia con tolerancias permitidas de 3mm + 0.5 PPM en horizontal y 6mm + 0.5PPM en vertical.

Estación Total Leica TC1103 con un alcance de 3000 m y una precisión en medición de ángulos Hz,V de 3” y en distancia 2mm + 2ppm / 1seg.

En el apéndice nº 3 del presente anejo, se adjunta certificados de calibración de los equipos topográficos.

En cuanto a los trabajos de gabinete para elaborar el Modelo Digital del Terreno se ha empleado el software topográfico TCP-MDT V4.

6. APÉNDICES DEL PRESENTE ANEJO

1. MÉTODO DE TRABAJO

Para la obtención de los datos topográficos, se han usado receptores GPS de doble frecuencia y con tecnología VRS, completándola cuando es necesario con topografía tradicional mediante el uso de estaciones totales.

Con este método, se ahorran recursos y se ahorra el tiempo empleado en el estacionamiento del receptor GPS, que sirve de base para enviar las correcciones diferenciales y así poder trabajar en modo RTK o tiempo real.

El concepto de VRS (Virtual Reference Station) se basa en una red de estaciones de referencia GPS continuamente conectadas mediante líneas telefónicas a un centro de control que constantemente recoge la información de la red de receptores, y envía las correcciones diferenciales al receptor móvil, de modo que se pueda tener en campo en tiempo real precisión centimétrica.

El receptor móvil es capaz de interpretar y usar los datos recibidos, en este caso a través de tecnología bluetooth mediante el teléfono móvil, de igual modo que si los datos viniesen de una estación de referencia real situada cerca del equipo móvil.

Para recibir las correcciones diferenciales, se usan, en función de la zona de trabajo, las estaciones de referencia del IGN y también la red de referencia virtual privada de Leica en Galicia. La transmisión de datos se realiza mediante NTRIP (Networked Transport of RTCM via Internet Protocol) que es un protocolo para el envío de datos GNSS por Internet. Estas correcciones son recibidas mediante un teléfono móvil con GPRS conectado al equipo topográfico GNSS.

2. IMPLANTACIÓN DE BASES DE REPLANTEO

Se han materializado mediante GPS un total de tres bases topográficas convenientemente localizadas. La relación de bases ha sido la siguiente:

BR-1 – BR-2 – BR-3

De las bases se proporciona reseña con el número de orden correspondiente.

3. CARTOGRAFÍA

Aproximadamente el 80% de todos los datos topográficos obtenidos, se tomaron mediante GPS con la tecnología VRS. El resto, debido principalmente a las zonas de sombra generadas por los edificios, estructuras y arboleda, se tomó mediante Estación Total. Para ello, fue necesario implantar bases topográficas auxiliares observadas previamente con GPS y precisión centimétrica.

El sistema de coordenadas utilizado ha sido ETRS89 UTM 29 N.

4. EQUIPOS UTILIZADOS

Se han usado los siguientes equipos topográficos:

- Receptor GS-16 Leica, con tecnología VRS.
- Material auxiliar.
- Software de oficina:
  - Leica Survey Office
  - Leica Geo Office Combinado
  - Cartomap 6.4
  - MDT
